

## Day 1

- [1] Find all functions  $f$  defined on the set of positive reals which take positive real values and satisfy:  $f(xf(y)) = yf(x)$  for all  $x, y$ ; and  $f(x) \rightarrow 0$  as  $x \rightarrow \infty$ .
- [2] Let  $A$  be one of the two distinct points of intersection of two unequal coplanar circles  $C_1$  and  $C_2$  with centers  $O_1$  and  $O_2$  respectively. One of the common tangents to the circles touches  $C_1$  at  $P_1$  and  $C_2$  at  $P_2$ , while the other touches  $C_1$  at  $Q_1$  and  $C_2$  at  $Q_2$ . Let  $M_1$  be the midpoint of  $P_1Q_1$  and  $M_2$  the midpoint of  $P_2Q_2$ . Prove that  $\angle O_1AO_2 = \angle M_1AM_2$ .
- [3] Let  $a, b$  and  $c$  be positive integers, no two of which have a common divisor greater than 1. Show that  $2abc - ab - bc - ca$  is the largest integer which cannot be expressed in the form  $xbc + yca + zab$ , where  $x, y, z$  are non-negative integers.

## Day 2

- [1] Let  $ABC$  be an equilateral triangle and  $\mathcal{E}$  the set of all points contained in the three segments  $AB$ ,  $BC$ , and  $CA$  (including  $A$ ,  $B$ , and  $C$ ). Determine whether, for every partition of  $\mathcal{E}$  into two disjoint subsets, at least one of the two subsets contains the vertices of a right-angled triangle.
- [2] Is it possible to choose 1983 distinct positive integers, all less than or equal to  $10^5$ , no three of which are consecutive terms of an arithmetic progression?
- [3] Let  $a$ ,  $b$  and  $c$  be the lengths of the sides of a triangle. Prove that

$$a^2b(a-b) + b^2c(b-c) + c^2a(c-a) \geq 0.$$

Determine when equality occurs.
