---

**Day 1**

- [1] Solve the system of equations:

$$\begin{aligned}x + y + z &= a \\x^2 + y^2 + z^2 &= b^2 \\xy &= z^2\end{aligned}$$

where  $a$  and  $b$  are constants. Give the conditions that  $a$  and  $b$  must satisfy so that  $x, y, z$  are distinct positive numbers.

- [2] Let  $a, b, c$  be the sides of a triangle, and  $S$  its area. Prove:

$$a^2 + b^2 + c^2 \geq 4S\sqrt{3}$$

In what case does equality hold?

- [3] Solve the equation  $\cos^n x - \sin^n x = 1$  where  $n$  is a natural number.

---

**Day 2**

- [4] Consider triangle  $P_1P_2P_3$  and a point  $p$  within the triangle. Lines  $P_1P, P_2P, P_3P$  intersect the opposite sides in points  $Q_1, Q_2, Q_3$  respectively. Prove that, of the numbers

$$\frac{P_1P}{PQ_1}, \frac{P_2P}{PQ_2}, \frac{P_3P}{PQ_3}$$

at least one is  $\leq 2$  and at least one is  $\geq 2$

- [5] Construct a triangle  $ABC$  if  $AC = b$ ,  $AB = c$  and  $\angle AMB = w$ , where  $M$  is the midpoint of the segment  $BC$  and  $w < 90$ . Prove that a solution exists if and only if

$$b \tan \frac{w}{2} \leq c < b$$

In what case does the equality hold?

- [6] Consider a plane  $\epsilon$  and three non-collinear points  $A, B, C$  on the same side of  $\epsilon$ ; suppose the plane determined by these three points is not parallel to  $\epsilon$ . In plane  $\epsilon$  take three arbitrary points  $A', B', C'$ . Let  $L, M, N$  be the midpoints of segments  $AA', BB', CC'$ ; Let  $G$  be the centroid of the triangle  $LMN$ . (We will not consider positions of the points  $A', B', C'$  such that the points  $L, M, N$  do not form a triangle.) What is the locus of point  $G$  as  $A', B', C'$  range independently over the plane  $\epsilon$ ?
