

TSTST 2012

### Day 1

- 1 Find all infinite sequences  $a_1, a_2, \dots$  of positive integers satisfying the following properties:
- (a)  $a_1 < a_2 < a_3 < \dots$ ,
  - (b) there are no positive integers  $i, j, k$ , not necessarily distinct, such that  $a_i + a_j = a_k$ ,
  - (c) there are infinitely many  $k$  such that  $a_k = 2k - 1$ .
- 
- 2 Let  $ABCD$  be a quadrilateral with  $AC = BD$ . Diagonals  $AC$  and  $BD$  meet at  $P$ . Let  $\omega_1$  and  $O_1$  denote the circumcircle and the circumcenter of triangle  $ABP$ . Let  $\omega_2$  and  $O_2$  denote the circumcircle and circumcenter of triangle  $CDP$ . Segment  $BC$  meets  $\omega_1$  and  $\omega_2$  again at  $S$  and  $T$  (other than  $B$  and  $C$ ), respectively. Let  $M$  and  $N$  be the midpoints of minor arcs  $\widehat{SP}$  (not including  $B$ ) and  $\widehat{TP}$  (not including  $C$ ). Prove that  $MN \parallel O_1O_2$ .
- 
- 3 Let  $\mathbb{N}$  be the set of positive integers. Let  $f : \mathbb{N} \rightarrow \mathbb{N}$  be a function satisfying the following two conditions:
- (a)  $f(m)$  and  $f(n)$  are relatively prime whenever  $m$  and  $n$  are relatively prime.
  - (b)  $n \leq f(n) \leq n + 2012$  for all  $n$ .
- Prove that for any natural number  $n$  and any prime  $p$ , if  $p$  divides  $f(n)$  then  $p$  divides  $n$ .

### Day 2

- 4 In scalene triangle  $ABC$ , let the feet of the perpendiculars from  $A$  to  $BC$ ,  $B$  to  $CA$ ,  $C$  to  $AB$  be  $A_1, B_1, C_1$ , respectively. Denote by  $A_2$  the intersection of lines  $BC$  and  $B_1C_1$ . Define  $B_2$  and  $C_2$  analogously. Let  $D, E, F$  be the respective midpoints of sides  $BC, CA, AB$ . Show that the perpendiculars from  $D$  to  $AA_2$ ,  $E$  to  $BB_2$  and  $F$  to  $CC_2$  are concurrent.
- 
- 5 A rational number  $x$  is given. Prove that there exists a sequence  $x_0, x_1, x_2, \dots$  of rational numbers with the following properties:
- (a)  $x_0 = x$ ;
  - (b) for every  $n \geq 1$ , either  $x_n = 2x_{n-1}$  or  $x_n = 2x_{n-1} + \frac{1}{n}$ ;
  - (c)  $x_n$  is an integer for some  $n$ .

- 6 Positive real numbers  $x, y, z$  satisfy  $xyz + xy + yz + zx = x + y + z + 1$ . Prove that

$$\frac{1}{3} \left( \sqrt{\frac{1+x^2}{1+x}} + \sqrt{\frac{1+y^2}{1+y}} + \sqrt{\frac{1+z^2}{1+z}} \right) \leq \left( \frac{x+y+z}{3} \right)^{5/8}.$$

### Day 3

- 7 Triangle  $ABC$  is inscribed in circle  $\Omega$ . The interior angle bisector of angle  $A$  intersects side  $BC$  and  $\Omega$  at  $D$  and  $L$  (other than  $A$ ), respectively. Let  $M$  be the midpoint of side  $BC$ . The circumcircle of triangle  $ADM$  intersects sides  $AB$  and  $AC$  again at  $Q$  and  $P$  (other than  $A$ ), respectively. Let  $N$  be the midpoint of segment  $PQ$ , and let  $H$  be the foot of the perpendicular from  $L$  to line  $ND$ . Prove that line  $ML$  is tangent to the circumcircle of triangle  $HMN$ .
- 8 Let  $n$  be a positive integer. Consider a triangular array of nonnegative integers as follows:

$$\begin{array}{ccccccc}
 \text{Row 1 :} & & & & & & a_{0,1} \\
 \text{Row 2 :} & & & & & a_{0,2} & a_{1,2} \\
 & & & & \vdots & \vdots & \vdots \\
 \text{Row } n-1 : & & & a_{0,n-1} & a_{1,n-1} & \cdots & a_{n-2,n-1} \\
 \text{Row } n : & a_{0,n} & a_{1,n} & a_{2,n} & \cdots & & a_{n-1,n}
 \end{array}$$

Call such a triangular array *stable* if for every  $0 \leq i < j < k \leq n$  we have

$$a_{i,j} + a_{j,k} \leq a_{i,k} \leq a_{i,j} + a_{j,k} + 1.$$

For  $s_1, \dots, s_n$  any nondecreasing sequence of nonnegative integers, prove that there exists a unique stable triangular array such that the sum of all of the entries in row  $k$  is equal to  $s_k$ .

- 9 Given a set  $S$  of  $n$  variables, a binary operation  $\times$  on  $S$  is called *simple* if it satisfies  $(x \times y) \times z = x \times (y \times z)$  for all  $x, y, z \in S$  and  $x \times y \in \{x, y\}$  for all  $x, y \in S$ . Given a simple operation  $\times$  on  $S$ , any string of elements in  $S$  can be reduced to a single element, such as  $xyz \rightarrow x \times (y \times z)$ . A string of variables in  $S$  is called *full* if it contains each variable in  $S$  at least once, and two strings are *equivalent* if they evaluate to the same variable regardless of which simple

# Art of Problem Solving

2012 TSTST

---

$\times$  is chosen. For example  $xxx$ ,  $xx$ , and  $x$  are equivalent, but these are only full if  $n = 1$ . Suppose  $T$  is a set of strings such that any full string is equivalent to exactly one element of  $T$ . Determine the number of elements of  $T$ .
