## **Art of Problem Solving** 2003 APMO

**APMO 2003** 

1 Let a, b, c, d, e, f be real numbers such that the polynomial

$$p(x) = x^8 - 4x^7 + 7x^6 + ax^5 + bx^4 + cx^3 + dx^2 + ex + f$$

factorises into eight linear factors  $x - x_i$ , with  $x_i > 0$  for i = 1, 2, ..., 8. Determine all possible values of f.

Suppose ABCD is a square piece of cardboard with side length a. On a plane are two parallel lines  $\ell_1$  and  $\ell_2$ , which are also a units apart. The square ABCD is placed on the plane so that sides AB and AD intersect  $\ell_1$  at E and F respectively. Also, sides CB and CD intersect  $\ell_2$  at G and H respectively. Let the perimeters of  $\triangle AEF$  and  $\triangle CGH$  be  $m_1$  and  $m_2$  respectively.

Prove that no matter how the square was placed,  $m_1 + m_2$  remains constant.

- 3 Let  $k \geq 14$  be an integer, and let  $p_k$  be the largest prime number which is strictly less than k. You may assume that  $p_k \geq 3k/4$ . Let n be a composite integer. Prove:
  - (a) if  $n = 2p_k$ , then n does not divide (n k)!;
  - (b) if  $n > 2p_k$ , then n divides (n k)!.
- 4 Let a, b, c be the sides of a triangle, with a + b + c = 1, and let  $n \ge 2$  be an integer. Show that

$$\sqrt[n]{a^n + b^n} + \sqrt[n]{b^n + c^n} + \sqrt[n]{c^n + a^n} < 1 + \frac{\sqrt[n]{2}}{2}.$$

Given two positive integers m and n, find the smallest positive integer k such that among any k people, either there are 2m of them who form m pairs of mutually acquainted people or there are 2n of them forming n pairs of mutually unacquainted people.
